PrimeGrid’s Sierpinski/Riesel Base 5 Problem

On 18 October 2014, 6:18:40 UTC, PrimeGrid’s Sierpinski/Riesel Base 5 Problem project eliminated k=109208 by finding the mega prime:

\[ 109208 \times 5^{1816285} + 1 \]

The prime is 1,269,534 digits long and will enter Chris Caldwell’s “The Largest Known Primes Database” (http://primes.utm.edu/primes) ranked 59th overall. This is the largest known base 5 mega prime. 37 k’s now remain in the Sierpinski Base 5 Problem.

The discovery was made by Scott Brown of the United States using an Intel(R) Core(TM)2 Quad CPU Q6700 @ 2.66GHz with 8GB RAM running Windows 7 Enterprise. This computer took about 11 hours 3 minutes to complete the primality test using LLR. Scott is a member of the Duke University team.

The prime was verified on 21 October 2014, 6:19:48 UTC by Tod Slakans of the United States using an Intel(R) Core(TM) i7-2600K CPU @ 3.40GHz with 8GB RAM running Microsoft Windows 7 Home Premium. This computer took about 3 hours 11 minutes to complete the primality test using LLR. Tod is a member of the Sicituradastra team.

Credits for the discovery are as follows:

1. Scott Brown (United States), discoverer
3. Srsieve, sieving program developed by Geoff Reynolds
4. LLR, primality program developed by Jean Penné

Entry in “The Largest Know Primes Database” can be found here: http://primes.utm.edu/primes/page.php?id=118643

Using a single PC would have taken years to find this prime. So this timely discovery would not have been possible without the thousands of volunteers who contributed their spare CPU cycles. A special thanks to everyone who contributed their advice and/or computing power to the search - especially all the sievers who work behind the scenes to make a find like this possible.

The Sierpinski/Riesel Base 5 Problem will continue to search for more primes. To join the search please visit PrimeGrid: http://www.primegrid.com
PrimeGrid’s
Sierpinski/Riesel Base 5 Problem

About PrimeGrid
PrimeGrid is a distributed computing project, developed by Rytis Slatkevičius, Lennart Vogel, and John Blazek, which utilizes BOINC and PRPNet to search for primes. PrimeGrid's primary goal is to bring the excitement of prime finding to the "everyday" computer user. Simply download the software and let your computer do the rest. Participants can choose from a variety of prime forms to search. With a little patience, you may find a large or even record breaking prime.

BOINC
The Berkeley Open Infrastructure for Network Computing (BOINC) is a software platform for distributed computing using volunteered computer resources. It allows users to participate in multiple distributed computing projects through a single program. Currently BOINC is being developed by a team based at the University of California, Berkeley led by David Anderson.

This platform currently supports projects from biology to math to astronomy. For more information, please visit BOINC: http://boinc.berkeley.edu

PRPNet
PRPNet is a client/server application written by Mark Rodenkirch that is specifically designed to help find prime numbers of various forms. It is easily ported between various OS/hardware combinations. PRPNet does not run each PRP test itself, but relies on helper programs, such as LLR, PFGW, phrot, wwww, and genefer to do the work.

For more information, please visit PrimeGrid’s PRPNet forum thread: http://www.primegrid.com/forum_thread.php?id=1215
