

PrimeGrid's The Riesel Problem

On 21 Nov 2010, 11:14:00 UTC, PrimeGrid's The Riesel Problem project eliminated $k=191249$ by finding the Mega prime:

$$191249 \cdot 2^{3417696} - 1$$

The prime is 1,028,835 digits long and enters Chris Caldwell's "The Largest Known Primes Database" (<http://primes.utm.edu/primes>) ranked 29th overall. This is the 2nd largest prime found in The Riesel Problem and the first k elimination in over 2 1/2 years. 63 k 's now remain.

The discovery was made by Jonathan Pritchard of the United Kingdom using an AMD Phenom 9950 with 8GB RAM, running Windows 7. This computer took 7 hours and 31 minutes to complete the primality test using LLR. Jonathan is a member of the Turan@BOINC team.

The prime was verified on 23 Nov 2010, 07:28:00, by Jan Haller of Germany using an Intel Pentium E5400 @ 2.70 GHz with 3 GB RAM, running 32 bit Windows XP Professional. This computer took a little over 6 hours 45 minutes to complete the primality test using LLR.

The credits for the discovery are as follows:

1. Jonathan Pritchard (United Kingdom), discoverer
2. PrimeGrid, et al.
3. Riesel Sieve
4. Srsieve, sieving program developed by Geoff Reynolds
5. LLR, primality program developed by Jean Penné

Entry in "The Largest Known Primes Database" can be found here:

Hans Ivar Riesel, a Swedish mathematician, showed in 1956 that there are an infinite number of positive odd integer k 's such that $k \cdot 2^n - 1$ is composite (not prime) for every integer $n \geq 1$. These numbers are now called Riesel numbers. He further showed that $k=509203$ was such one.

It is conjectured that 509203 is the smallest Riesel number. The Riesel Problem consists in determining that 509203 is the smallest Riesel number. To show that it is the smallest, a prime of the form $k \cdot 2^n - 1$ must be found for each of the positive integer k 's less than 509203. For more information about The Riesel Problem, please visit Wilfrid Keller's **The Riesel Problem: Definition and Status** (<http://www.prothsearch.net/rieselprob.html>).

Using a single PC would have taken years to find this prime. So this timely discovery would not have been possible without the hundreds of volunteers who contributed their spare CPU cycles. In honor of the previous effort, this first prime is shared with Riesel Sieve. A special thanks to everyone who offered their advice and/or computing power to the search - especially Sean Faith and Brian Carpenter who provided support information from the previous Riesel Sieve effort.

The Riesel Problem project will continue to seek primes for the 63 remaining k 's. To join the search please visit PrimeGrid: <http://www.primegrid.com>

PrimeGrid's The Riesel Problem

About PrimeGrid

PrimeGrid is a distributed computing project, developed by Rytis Slatkevičius, which utilizes BOINC and PRPNet to search for primes. PrimeGrid's primary goal is to bring the excitement of prime finding to the "everyday" computer user. Simply download the software and let your computer do the rest. Participants can choose from a variety of prime forms to search. With a little patience, you may find a large or even record breaking prime.

BOINC

The Berkeley Open Infrastructure for Network Computing (BOINC) is a software platform for distributed computing using volunteered computer resources. It allows users to participate in multiple distributed computing projects through a single program. Currently BOINC is being developed by a team based at the University of California, Berkeley led by David Anderson.

This platform currently supports projects from biology to math to astronomy. For more information, please visit BOINC: <http://boinc.berkeley.edu>

PRPNet

PRPNet is a client/server application written by Mark Rodenkirch that is specifically designed to help find prime numbers of various forms. It is easily ported between various OS/hardware combinations. PRPNet does not run each PRP test itself, but relies on helper programs, such as LLR, PFGW, phrot, and genefer to do the work.
